

Puma 2 - Pre marking

The Puma 2 is a spray-can activator that makes pre-marking possible from any type of vehicle. The Puma 2 consists of two units, the spray and control-unit. Since the Puma 2 operates without an encoder it is possible to mount it on almost any vehicle. Instead of using an encoder the driver simply inputs the desired speed and the control unit then calculates the right line lengths.

The speed input can be made in km/h or m/min.

The spray can activator will fit most ordinary spray cans.

Both

Both of the units are outfitted with strong magnets so that they can be placed on any magnetic surface without screws. The unit is simply placed and then plugged in to a 12v or 24v output (the unit is delivered for 12v or 24v).
